

AMWA AS-11

A New Approach to the Design & Publication of AS-11 Specifications

Rules Based Specifications

Rules Based Specifications for AS-11

The AMWA AS-11 family of Specifications define constrained media file formats for the delivery of finished media assets to a broadcaster or publisher. Each Specification is developed for a particular business purpose.

AS-11 Specifications are not required to have any technical properties in common. This means that the different AS-11 Specifications are not required to inter-operate.

However, the rules / Blocks based construction of the Specifications makes it easy to determine what the AS-11 Specifications have in common and how they differ. This helps software developers to maximise code re-use.

It also makes it easy to build new AS-11 Specifications out of the Blocks of existing Specifications.

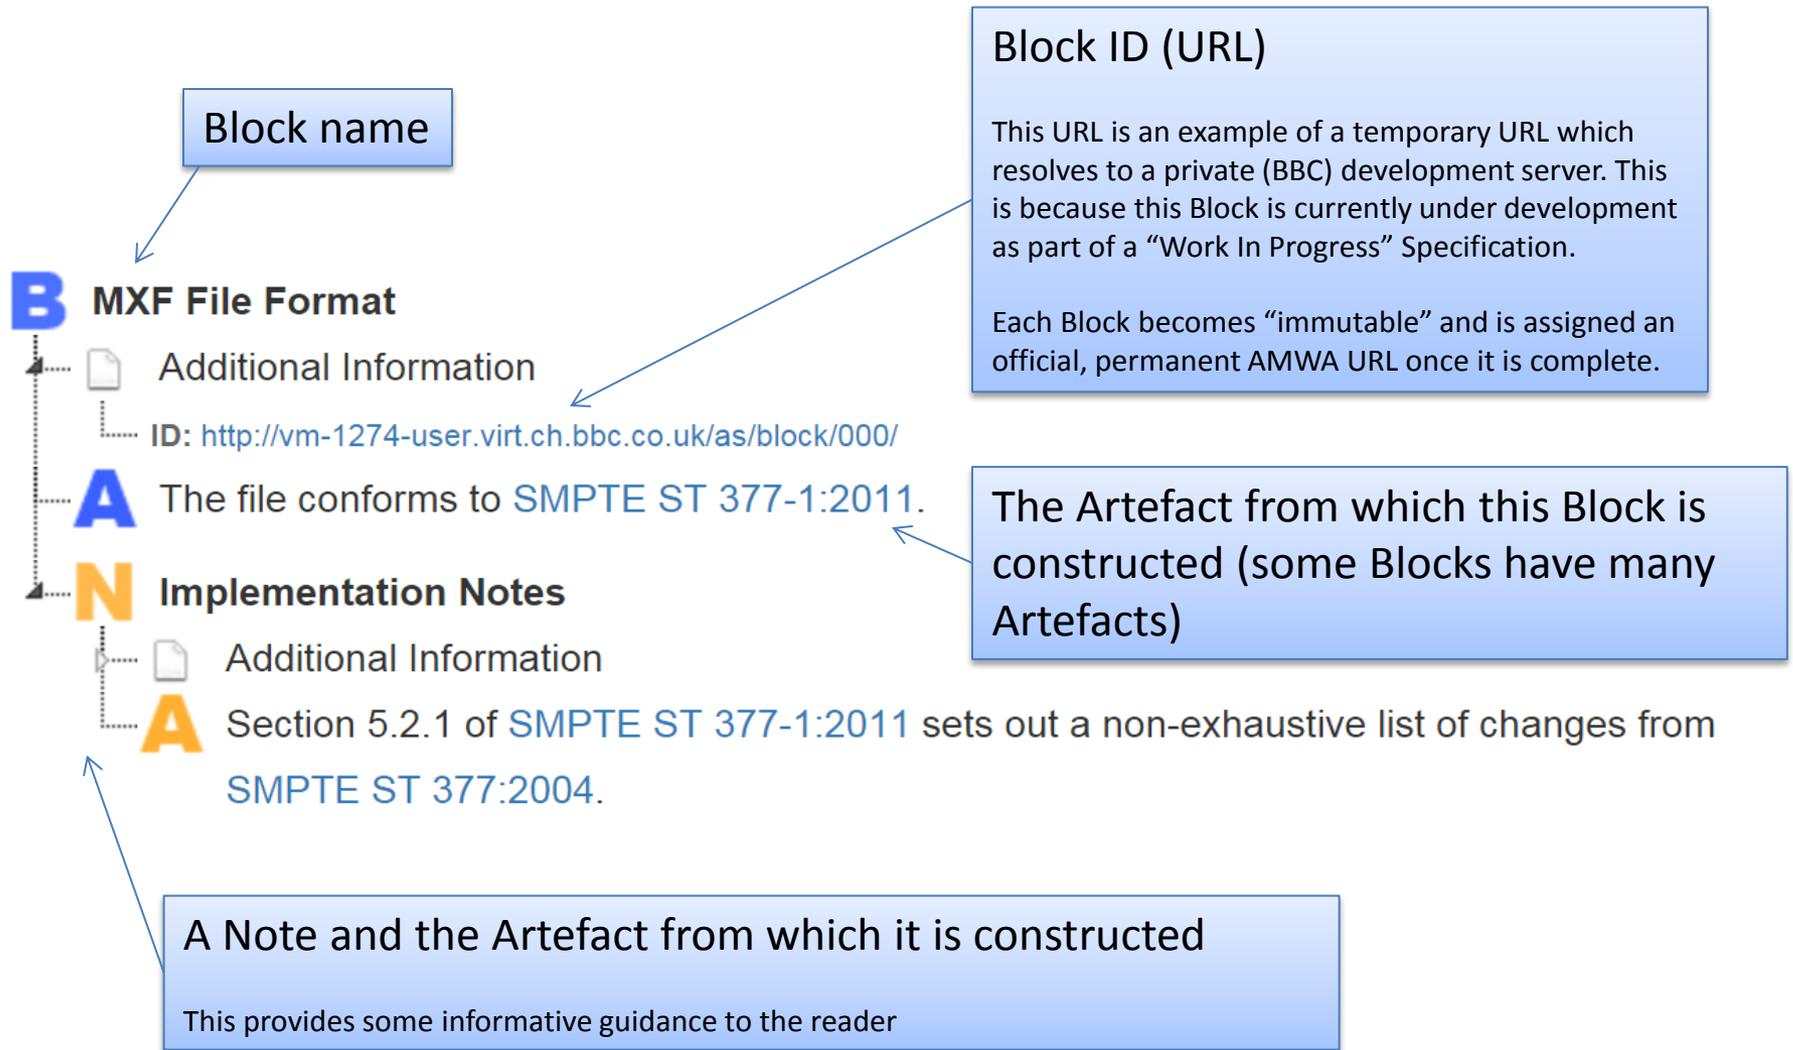

Goals of Rules based Specifications:

- easier to build new Specifications from common building blocks
- express Specifications in a machine-friendly way
- focus on making constraints concise, unambiguous and testable

Rules based Specification construction:

- Each Specification is composed of **Blocks (B)**
- Each Block exists independently and is identified by a unique URL. A Block could be used in many different Specifications.
- Blocks are made of **Artefacts (A)** and links to other Blocks
Artefacts could be statements expressed as XML, XML metadata definitions, Python code files, etc
- There are also **Notes (N)**, external **References (R)** and defined **Terms (T)**

Rules based “Specification Tree” example

Publishing using GitHub

Publishing using GitHub – Introduction

Specifications are treated like software – each Specification is published as a repository on GitHub. The Specification can be viewed on the GitHub website or cloned / downloaded for offline use.

Each Specification on GitHub has:

- a full change history
- “tagged” versions of the Specification

Each Specification contains HTML and text renderings (or “views”) of the Specification along with useful machine-readable files such as XML Schema files or Python code files.

[Work In Progress] AS-11 X2 (MXF Program Contribution - HD Intra)

This repository contains the full details of this AMWA Specification. For the latest version of this repository please refer to [its GitHub project](#).

Getting Started

How a Specification relates to the rules (Blocks) framework – *simple*

Someone who wants to read a Specification just needs to look at the GitHub repository for that Specification. That repository includes all the details they need in order to understand the Specification.

The Specification is, of course, structured in terms of its Blocks (as shown earlier). However, the full details of the rules based (Blocks) framework remain “behind the scenes”: it only needs to be used by Specification writers and those who want to analyse Specifications (for example to see which Blocks Specifications have in common).

How a Specification relates to the rules (Blocks) framework – *more detailed*

- Each AS-11 Specification is formally published as a git repo – a “package” generated from the relevant Blocks and including selected Artefacts
- So, it consists of some Artefacts from the rules (Blocks) framework and renderings of Blocks / Artefacts from the rules (Blocks) framework
- So, the contents of the git repo must not be directly edited – any Specification edits require edits within the Blocks framework → re-generate the “package” and overwrite the git repo contents
- It means that the Specification can persist and be read independently / standalone from the rules (Blocks) framework
- Many Blocks will appear in many of the Specs. That is a good thing and does not affect the process. If a Block is used in three Specifications then its details will simply be duplicated across three Specification git repos when they are generated. The “master” details for the Block are managed “behind the scenes” in the rules (Blocks) framework.

The RFC-style publication process

Using the new AMWA Specification publication process for AS-11 Specifications

Each Specification is published separately as a GitHub repository.

Over its lifetime a Specification moves through three “Maturity Levels” (summarised on the next page).

Publication at all three Levels is public – no need to be an AMWA member to read the Specifications.

The aim is for all AS-11 Specifications to become “Proposed Specifications” as soon as sufficient review has been received for all design decisions to be made.

Specification “Maturity Levels”

Work In Progress

At this level an AS-11 Specification is substantially complete but some design decisions still need to be reviewed and / or additional details added

An AS-11 Specification is elevated to the next level when it has been reviewed and all design decisions have been made

Proposed Specification

At this level an AS-11 Specification can be described as relatively “stable” (there could possibly be bug fixes and improvements to address issues found during real-world implementation & use)

An AS-11 Specification is elevated to the next level when several real-world implementations have been carried out

Specification

At this level an AS-11 Specification is “stable” and several real-world implementations exist
